			Hal 1 dari 7

## A. Kompetensi

Setelah mengikuti praktikum ini, mahasiswa diharapkan mampu menggunakan Sliders serta Change Events.

## B. Dasar Teori

The `JSlider` class represents a graphical slider. Like scrollbars, sliders can have either a horizontal or vertical orientation. With sliders, however, you can enhance their appearance with tick marks and labels. In most instances, a slider is preferable to a standalone scrollbar. Sliders represent a selection of one value from a bounded range. Scrollbars represent a range of values within a bounded range and are best used in things like the `JScrollPane`. The `JSlider` class allows you to set the spacing of two types of tick marks: major and minor. Major tick marks are longer than minor tick marks and are generally used at wider intervals. Figure 1 shows various sliders that can be composed in Swing.

Figure 1. Various sliders in Swing

Figure 2. `JSlider` component with horizontal orientation

`JSlider` enable the user to select from a range of integer values. Class `JSlider` inherits from `JComponent`. Figure 2 shows a horizontal `JSlider` with **tick marks** and the **thumb** that allows the user to select a value. `JSlider` can be customized to display major tick marks, minor tick marks and labels for the tick marks. They also support **snap-to ticks**, which cause the thumb to snap to the closest tick mark when it is positioned between two tick marks.

## Constructors

`public JSlider()`

Creates a horizontal slider with the range 0 to 100 and an initial value of 50.

			Hal 2 dari 7

*public JSlider(int orientation)*

Creates a slider using the specified orientation with the range 0 to 100 and an initial value of 50.

*public JSlider(int min, int max)*

Creates a horizontal slider using the specified min and max with an initial value equal to the average of the min plus max.

*public JSlider(int min, int max, int value)*

Creates a horizontal slider using the specified min, max and value.

*public JSlider(int orientation, int minimum, int maximum, int value)*

Creates a slider with the specified orientation and the specified minimum, maximum, and initial values.

*public JSlider(BoundedRangeModel brm)*

Creates a horizontal slider using the specified BoundedRangeModel.

Set the initial values of the slider. The orientation must be either `JSlider.HORIZONTAL` or `JSlider.VERTICAL`. If anything else is passed in, the `JSlider` object throws a runtime `IllegalArgumentException`. The remaining parameters are used to initialize the slider's bounded-range model. If the parameters are not given, they are initialized to the default values.

The `setPaintTicks()` method sets a `boolean`, which is used to activate or deactivate the slider's tick marks. In some L&Fs, the slider changes from a rectangular shape to a pointer when tick marks are activated. This is often done to give the user a more accurate representation of where the slider falls.

`JSlider` triggers a `ChangeEvent` whenever the user modifies any of its properties. It also generates a `PropertyChangeEvent` whenever any of its properties change.

```
public void addChangeListener(ChangeListener l)
public void removeChangeListener(ChangeListener l)
```

Add or remove a specific listener from receiving property change events generated by the `JSlider` object.

**Listing 1, for drawing circles of a specified diameter.**

```
import java.awt.Graphics;
import java.awt.Dimension;
import javax.swing.JPanel;

public class OvalPanel extends JPanel {
    private int diameter = 10 ; // default diameter of 10

    // draw an oval of the specified diameter
```

```

public void paintComponent(Graphics g) {
    super .paintComponent(g);
    g.fillOval( 10, 10, diameter, diameter ); // draw circle
} // end method paintComponent

// validate and set diameter, then repaint
public void setDiameter(int newDiameter) {
    // if diameter invalid, default to 10
    diameter = ( newDiameter >= 0 ? newDiameter : 10 );
    repaint(); // repaint panel
} // end method setDiameter

// used by layout manager to determine preferred size
public Dimension getPreferredSize() {
    return new Dimension( 200, 200 );
} // end method getPreferredSize

// used by layout manager to determine minimum size
public Dimension getMinimumSize() {
    return getPreferredSize();
} // end method getMinimumSize
} // end class OvalPanel

```

**Listing 2,** `JSlider` value used to determine the diameter of a circle.

```

import java.awt.BorderLayout;
import java.awt.Color;
import javax.swing.JFrame;
import javax.swing.JSlider;
import javax.swing.SwingConstants;
import javax.swing.event.ChangeListener;
import javax.swing.event.ChangeEvent;

public class SliderFrame extends JFrame {
    private JSlider diameterJSlider; // slider to select diameter
    private OvalPanel myPanel; // panel to draw circle

// no-argument constructor
public SliderFrame() {
    super ( "Slider Demo" );
    myPanel = new OvalPanel(); // create panel to draw circle
    myPanel.setBackground( Color.YELLOW ); // set background to yellow

```

```

### C. Alat/ Bahan

1. Lab. Sheet Pemrograman Java 12
2. PC / Laptop with OS installed
3. JDK 1.5 or latest
4. J-Creator or text editor

### D. Langkah Kerja

1. Baca dan pahami dasar teori di atas.
2. Lakukan kompilasi dan eksekusi terhadap contoh-contoh source code atau program yang ada di dasar teori dan LAMPIRAN.
3. Kerjakan tugas individu di bawah.

### E. Tugas Individu

Buatlah sebuah aplikasi yang menggunakan Slider serta component lain, seperti contoh di bawah ini.

- ✓ Slider Zoom untuk mengatur ukuran label "SLIDERS AND CHANGE EVENTS".
- ✓ Slider Posisi Vertikal untuk mengatur ukuran label "SLIDERS AND CHANGE EVENTS".
- ✓ Slider Posisi Horizontal untuk mengatur ukuran label "SLIDERS AND CHANGE EVENTS".
