Yogyakarta, 7 – 8 May 2018

FMIPA UNIVERSITAS NEGERI YOGYAKARTA

Proceedings of The 5th International Conference On Research, Implementation And Education Of Mathematics And Sciences (5th ICRIEMS): Revitalizing Research And Education On Mathematics And Science For Innovations And Social Development

Organizing Committee:

Agung Wijaya Subiantoro, Ed.D. (Chair)
Kismiantini, Ph.D. (Vice Chair)
Nur Aeni Ariyanti, Ph.D (Secretary)
Dr. Sri Andayani (Treasury)
Dr. Karyati (Program Coordinator)

Advisory Board (Steering Committee):

Prof. Dr. Wim T van Horssen (TU Delft, Netherland)
Prof. Dr. Yoshisuke Kumano (Shizuoka University, Japan)
Prof. Saberi Bin Othman (Universiti Pendidikan Sultan Idris, Malaysia)
Prof. Dr. Mudasir, M.Eng. (Universitas Gadjah Mada, Indonesia)
Osval Antonio Montesinos Lopez, Ph.D (University of Colima, Mexico)
Allen Price, Ph.D (Emmanuel College Boston, USA)
Hasan Daupor, Ph.D (Yala Rajabhat University, Thailand)
Dr. Hartono (Dean, Advisory Board Chair, Universitas Negeri Yogyakarta)
Dr. Slamet Suyanto (Vice Dean, Universitas Negeri Yogyakarta)

Reviewers:

Prof. Ferry Butar Butar, Ph.D. (Sam Houston State University, USA)
Prof. Muammer Calik, Ph.D. (Karadeniz Technical University, Turkey)
Prof. Dr. Fang-Ying Yang (National Taiwan Normal University)
Prof. (Assoc.) Dr. Azmi Mohamed (Universiti Pendidikan Sultan Idris, Malaysia)
Prof. Dr. Marsigit (Yogyakarta State University)
Prof. Dr. Jumadi (Yogyakarta State University)
Prof. Dr. Sriatun (Yogyakarta State University)
Prof. Dr. A.K. Prodjosantoso (Yogyakarta State University)
Prof. Dr. IGP. Suryadarma (Yogyakarta State University)
Prof. Dr. Bambang Subali (Yogyakarta State University)
Prof. Dr. Zuhdan Kun Prasetyo (Yogyakarta State University)

Editors:

Dr. Supardi
Evy Yulianti, M.Sc.
Nikenasih Binatari, M.Si.
Himmawati Puji Lestari, M.Si.
Didik Setyawarno, M.Pd.

Preface

This proceedings is the regular edition (non-Scopus-indexed) of the conference proceedings of the 5th International Conference on Research, Implementation, and Education of Mathematics and Sciences (ICRIEMS) held by the Faculty of Mathematics and Science, Yogyakarta State University, Indonesia on 7 – 8 May 2017 at Eastparc Hotel Yogyakarta. All papers in this proceeding were obtained from a selection process by a team of reviewers and had already been presented in the conference. Some selected papers from the conference were compiled under separate proceedings and published by Institute of Physics (IoP) which is Scopus-indexed. This proceedings comprises 9 fields, they are mathematics, mathematics education, physics, physics education, chemistry, chemistry education, biology, biology education, and science education.

The theme of this 5th ICRIEMS is '*revitalizing research and education on mathematics and science for innovations and social development*'. This conference presented five keynote speakers, which were Prof. Dr. Fang-Ying Yang (Graduate Institute of Sciences Education, National Taiwan Normal University), Prof. Muammer Calik, Ph.D (Karadeniz Technical University, Turkey), Prof. Ferry Butar Butar, Ph.D. (Department of Mathematics and Statistics, Sam Houston State University, USA), and Prof. Dr. Eng Khairurrijal (Department of Physics, Bandung Institute Technology, Indonesia), and two invited speakers, which were Prof. (Assoc.) Dr. Azmi Mohamed (Department of Chemistry, Universiti Pendidikan Sultan Idris, Malaysia) and Dr. Lilla Adulyasas (Yala Rajabat University, Thailand). Besides the keynote and invited speakers, there were also parallel articles that present the latest research results in the field of mathematics, sciences, and education. These parallel session speakers came from researchers from Indonesia and abroad.

Hopefully, this proceeding may contribute in disseminating research results and studies in the field of mathematics, sciences and education such that they are accessible by many people and useful for the development of our civilization.

Yogyakarta, October 2018

Editorial Team

Forewords From The Head of Committee 2018

Assalamu'alaikum warahmatullahi wabarakatuh.

On behalf of the organising committee of the 5th ICRIEMS, please let me welcome you to Yogyakarta, Indonesia. Nothing is more precious for us, besides enable to fete you all here, in the 5th of the International Conference on Research, Implementation, and Education of Mathematics and Science, that is organized by the Faculty of Mathematics and Science, Yogyakarta State University.

It is not only about the research as well as the papers that will be presented. But it is also about the academic networks, mutual cooperation, and meaningful communications amongst us – the researchers, academics, and educators – those which we are expecting to be built and established, in this conference. We believe that this occasion may lead our commitment to strength our roles together, particularly to achieve the innovation and social development through research and education on mathematics and science, as it is accentuated by the theme of this conference.

We are strongly considered that this conference would not be meaningful without other parties. Therefore, I would like to express my highest appreciation and gratitude to our keynote speakers and invited speakers. They are:

1. Prof. Ferry Butar Butar, Ph.D.,
2. Prof. Muammer Calik, Ph.D.,
3. Prof. Dr. Eng Khairurrijal, M.Si.
4. Prof. Dr. Fang-Ying Yang
5. Prof. Assoc. Dr. Azmi Mohamed
6. Dr. Lilla Adulyasas.

I also would like to address our big thank to our motivated and valuable participants. There are 570 papers will be presented and 2 posters displayed, out of 575 registered participants. A few selected papers would be published in the Scopus-indexed proceeding whilst others will be in either regular proceeding or journals.

We believe that there would be any shortcomings and inconveniences in this conference. Thus, we really apologize. We hope that this conference will be very succesful. Have a nice talk, discussion, and surely enjoy Yogyakarta. Thank you.

Wassalamu'alaikum warahmatullahi wabarakatuh.

Yogyakarta, May 2018

Agung W. Subiantoro

Forewords From the Dean of Faculty of Mathematics and Sciences, Universitas Negeri Yogyakarta

Assalamu'alaikum warahmatullahi wabarakatuh. May peace and God's blessings be upon you all.

On behalf of the Committee, first of all allow me to extend my warmest greeting and welcome to the 5th International Conference on Research, Implementation, and Education of Mathematics and Sciences 2018, organized by Faculty of Mathematics and Natural Sciences (FMNS) Yogyakarta State University.

To celebrate the 54th Anniversary of Yogyakarta State University, our faculty has an opportunity to conduct the 5th ICRIEMS 2018 with the theme of Revitalizing Research and Education on Mathematics and Science for Innovations and Social Development. This conference proudly presents five keynote speeches by five fabulous speakers: Prof. Ferry Butar Butar, Ph.D., Prof. Muammer Calik, Ph.D., Prof. Dr. Eng Khairurrijal, M.Si., and Prof. Dr. Fang-Ying Yang and two invited speakers: Prof. Assoc. Dr. Azmi Mohamed and Dr. Lilla Adulyasas.

The independence of a country is impossible to gain if the education does not become the priority and it is not supported with the development of technology. We all know that the technology development could be achieved if it is supported by the improvement of firm fundamental knowledge. The empowerment of fundamental knowledge could not be separated from research which is related to the development of technology and the learning process in school and universities.

This conference is aimed to pull together researchers, educators, policy makers, and practitioners to share their critical thinking and research outcomes. Therefore, we are able to understand and examine the development of fundamental principle, knowledge, and technology. By perceiving the matters and condition in research and education field of mathematics and sciences, we could take a part in conducting qualified education to reach out the real independence of our nation.

This conference will be far from success and we could not accomplish what we do without the support from various parties. So let me extend my deepest gratitude and highest appreciation to all committee members. I would also like to thank each of participants for attending our conference and bringing your expertise to our gathering. Should you find any inconveniences and shortcomings, please accept my sincere apologies.

Wa'alaikumsalam warahmatullahi wabarakatuh.

Yogyakarta, May 2018

Dr. Hartono

Conference Program

THE 5th INTERNATIONAL CONFERENCE ON RESEARCH, IMPLEMENTATION & EDUCATION OF MATHEMATICS AND SCIENCES (ICRIEMS) 2018 7-8 MAY 2018, HOTEL EASTPARC, YOGYAKARTA, INDONESIA

#DAY 1: MONDAY, 7 MAY 2018

TIME	PROGRAM
07.00 – 08.00 AM	Registration
08.00 – 09.00 AM	Opening Ceremony 1. Opening 2. National Anthem: 3. Traditional Dance: 4. Welcome Speech: Chairman of ICRIEMS 2018 5. Opening Conference by Rector of YSU 6. Photo Session
09.00 – 09.30 AM	Tea/Coffee Break
09.30 – 12.00 PM	Keynote Speech #1 : Prof. Ferry Butar Butar, Ph.D. Keynote Speech #2 : Prof. Dr. Eng Khairurrijal, M.Si
12.00 – 01.00 PM	Lunch Break
01.00 – 05.00 PM	Parallel Sessions & Coffee Break

#DAY 2: TUESDAY, 8 MAY 2018

TIME	PROGRAM
07.00 – 08.00 AM	Registration
08.00 – 09.30 AM	Keynote Speech #3: Prof. Muammer Calik, Ph.D
09.30 – 10.00 AM	Tea/Coffee Break
10.00 – 11.30 AM	Keynote Speech #4: Prof. Dr. Fang-Ying Yang
11.30 AM – 00.30 PM	Lunch Break
00.30 – 04.00 PM	Parallel Sessions & Coffee Break
04.00 – 04.30 PM	Certificate Collection

#DAY 3: WEDNESDAY, 9 MAY 2018

TIME	PROGRAM
07.00 AM – 05.00 PM	City tour

Table of Content

		Page
	Front Cover	i
	Organizing Committee, Advisory Board, Editorial Board and Reviewers	ii
	Preface	iii
	Forewords From The Head of Committee	iv
	Forewords From The Dean of Faculty	v
	Conference Program	vi
	Table of Content	vii
	Regular Papers:	
	MATHEMATICS	
01	A Mathematical Model of Influenza Spread of Two Strains with Cross Immunity <i>Hilda Fahlana</i>	M – 1
02	Predicting TB Death Using Logistic Regression and Decision Tree on VA Data <i>Muhamad Rifki Taufik, Apiradee Lim, Phatrawan Tongkumchun, and Nurin Dureh</i>	M – 7
03	Position Estimation of ITSUNUSA AUV Based on Determined Trajectory using Kalman Filter (KF) <i>Teguh Herlambang, Subchan and Hendro Nurhadi</i>	M - 15
04	ARIMAX, FFNN, and Hybrid ARIMAX-FFNN Methods for Forecasting Pertamina <i>Uzlifatus Syarifah, Heri Kuswanto, and Suhartono</i>	M - 23
05	Modeling The Number of Infant Mortality in East Java Using Hierarchical Bayesian Approach <i>Prizka Rismawati Arum, Nur Iriawan, and Muhammad Mashuri</i>	M - 33
06	The Control Design on Non-Minimum Phase Nonlinear Systems with Relative Degree Two <i>Ahmadin, Janson Naiborhu, Roberd Saragih</i>	M - 41
07	Parameter Estimation of Bayesian Multivariate Regression Model with Informative Prior Distribution: Multivariate Normal and Inverse Wishart <i>Dewi Retno Sari Saputro, Dina Arieq Prasdika, Purnami Widyaningsih, and Kornelius Ronald Demu</i>	M - 47
08	Total Edge Irregularity Strength of Book Graphs of Several Types <i>Lucia Ratnasari, Sri Wahyuni, Yeni Susanti and Diah Junia E.P</i>	M - 57
09	The Estimation of Binary Nonparametric Regression Model based on The	M - 65

	Kernel Estimator by Generalized Additive Models Method <i>Suliyanto, Marisa Rifada, Eko Tjahjono and Sediono</i>	
10	The Norwegian Traffic Light Models and Its Modifications Using The Basic Petri Net <i>Tomi Tristono, Setiyo Daru Cahyono, Sutomo, and Pradityo Utomo</i>	M - 73
11	Goal Programming on Production Planning Using Ant Colony Optimization-Genetic Algorithm (ACOGA) <i>Dinita Rahmalia, Thomy Eko Saputro, Teguh Herlambang</i>	M - 81
12	Study Ethnomathematics: Classification of Geometrical Aspects of Traditional Timor Woven Fabrics by Ornamental Group <i>Erina Widiani</i>	M – 89
13	The Binary Logistic Regression for Index Numbers of Monthly Stock Price <i>Mutijah</i>	M - 97
14	Choosing Initial Hyper-Parameter Based on Simple Feature Data for Gaussian Process Time Series State Space Models <i>S S Sholihat</i>	M - 103
15	Claims Reserving Estimation for BPJS Using Archimedean Copulas <i>Yuciana Wilandari, Sri Haryatmi Kartiko, and Adhitya Ronnie Effendie</i>	M - 113
16	On The Inclusion Between Weak Lebesgue Spaces and Stummel Classes <i>N K Tumulun, H Gunawan, J Lindiarni</i>	M - 121

MATHEMATICS EDUCATION

01	Understanding How Blind Student Learn Rigorous Mathematical Thinking on Two-Dimensional Shapes <i>Andriyani</i>	ME – 1
02	Characteristics of Effective Mathematics Teachers in Rural Areas <i>Roseleena Sumiati and Jailani</i>	ME – 7
03	Analysis of Metacognitive Skills of Undergraduate Students in Solving Math Problems <i>Faliqul Jannah Firdausi</i>	ME – 15
04	Mathematics Disposition of Vocational High School Students Viewed by Adversity Quotient <i>Muhammad Darmawan Dewanto, Budiyono, Hasih Pratiwi</i>	ME - 29
05	Improving Students' Interpersonal Skills Through Problem-Based Learning <i>U Santria, and J Jailani</i>	ME - 37

06	Implementing Van Hiele Theory on Circle Module <i>Isnaeni Umi Machromah, Christina Kartika Sari, Mega Eriska Rosaria Purnomo</i>	ME - 45
07	Students' Geometry Skills Viewed from Van Hiele Thinking Level <i>Dwi Laila Sulistiowati, Tatang Herman, Al Jupri</i>	ME - 55
08	Students' Error in Derivatives of Functions Concept <i>Arum Dahlia Mufidah, Didi Suryadi, and Rizky Rosjanuardi</i>	ME - 63
09	Algebraic Skills on Solving PISA Problems <i>Luthfiah Asri and Zulkardi</i>	ME - 71
10	Learning to Think Mathematically Through Reasoning and Problem Solving in Secondary School Mathematics: A Literature Review <i>Nanang Ade Putra Yaman and Jailani</i>	ME - 77
11	Investigating Vocational School Students' Difficulties in Solving Basic Mathematics Problems as Their Prior Knowledge <i>Irham Baskoro, W Setyaningrum</i>	ME - 83
12	Implementation of Guided Inquiry Learning to Improve the Collaborative Skills of Mathematics <i>Syahlan Romadon and Ali Mahmudi</i>	ME - 91
13	Activated Scheme in Pattern Problems by Student with Low Mathematics Ability <i>Helti Lygia Mampouw, Agung Lukito, St. Suwarsono</i>	ME - 97
14	Mathematics Anxiety: Causes and the Effects on Student's Mathematics Achievement <i>Primaningtyas Nur Arifah and Djamilah Bondan Widjajanti</i>	ME - 105
15	Improving Student Interaction in Mathematics Learning Through Problem Based Learning <i>Nira Arsoetar, and J Jailani</i>	ME - 111
16	Modification of Polya's Step to Solve Math Story Problem <i>Isfa Hayyulbathin, Retno Winarni, Tri Murwaningsih</i>	ME - 119
17	Students' Understanding of Negatif Integers and Its Operations Based on Pseudo-Scaffolding <i>S N A Aziz, Y Fuad, and R Ekawati</i>	ME - 127
18	Students' Fraction Magnitude Knowledge in Solving Equation Word Problems <i>I K Amalina, Y Fuad, and Masriyah</i>	ME - 133
19	Task Commitment : Concept, Characteristic, and Its Relationship to Student Mathematics Achievements <i>N R Kurniasih and I Harta</i>	ME - 141

20	Categorizations of Students' Reasoning Behavior for Solving Integer Comparison Problems in Elementary School <i>R Febriyanti, Y Fuad, and Masriyah</i>	ME - 147
21	Analysis and Evaluation of Decision-Making Factors Prospective Students Choose Department of Statistics (Case study on Student of Statistics Department UII Acceptance year 2015 – 2017) <i>Achmad Fauzan, Asmadhini Handayani Rahmah and Sendhyka Cakra Pradana</i>	ME - 155
22	Relationship Analysis Between Mathematics Problem Solving Skill and Student's Mathematics Anxiety Level <i>Fatya Azizah and Hartono</i>	ME-163
23	The Effectiveness of E-learning Media with Guided Discovery Method from The Perspective of Student's Mathematics Problem Solving Skill <i>Ulfa Lu'luilmaknun and Dhoriva Urwatul Wutsqa</i>	ME-169
24	Student's mathematical communication ability after applying missouri mathematics project with problem solving approach <i>A Aprisal and A M Abadi</i>	ME-177
25	An Analysis <i>Experiential Learning</i> on The Mathematical Critical Thinking Ability in Primary School <i>Hamdah Munawaroh, Sudiyanto, Riyadi</i>	ME-185
26	Identification of Calculation and Measurement Estimation Strategies Based on Visual-Spatial Intelligence <i>Siti Lailiyah, Ahmad Lubab, Agus Prasetyo Kurniawan, Sutanti Dwi Payanti</i>	ME-193
27	Longitudinal Study Process Cognitive for Mathematics Education Students In Problem Solving Mathematics and Physics <i>Muh. Rizal and Jusman Mansyur</i>	ME-201
28	Intertwining Characteristic In Realistic Mathematics Education (RME) In Learning of Linear and Quadratic Equations System <i>Florensius Widodo Yulianto</i>	ME-211
29	The Influence of <i>MathLite</i> on Motivation and Mathematics Anxiety of IV Graders Elementary School <i>Yohana Setiawan and Yulia Ayriza</i>	ME-219
30	Analysis of Students' Higher Order Thinking Skills in Solving The Contextual Problem <i>Tea Tasia Wiwin, Marcellinus Andy Rudhito and Herman Joseph Sriyanto</i>	ME-225
31	Problem Solving On The Linear Program <i>Lokana Firda Amrina and R. Rosnawati</i>	ME-233
32	Analysis of the Problem Solving Ability of VIII-A Student on Linear Equation System of Two Variables (LESTV) <i>Bernadus Bin Frans Resi and Hongki Julie</i>	ME-237

- 33 **The Students' and Teacher Reflection for Introduction Probability Theory Course at 2016** ME-243
Hongki Julie
- 34 **Profile Students' Understanding on The Linear Equation and Inequalities in One Variable of Grade VIII Junior High School** ME-249
A. Sri Mardiyanti Syam, Heri Retnawati

Abstract. The standards of learning process for pre-service science teachers in Indonesia need to be improved, especially related to the international benchmarking surveys. One of surveys is the Program for International Student Assessment (PISA) which measures the aspect of what the students know and what they can do (applications) with their knowledge. This study aimed at producing a training model for pre-service science teachers in developing an assessment with the standard of international benchmarking survey in this case PISA in order to be able to compete in global market. The subject of this research was the students of pre-service teacher in the Study Program of Science Education, Faculty of Mathematics and Science, UNY. The research method was using Research and Development (Thiagarajan, S., et al, 1974) with Four-D Models, which was modified through Barg & Gall's R & D model (1983). The research stages included Define; Design; Develop and Disseminate. The results of this study are (1) the valid pre-service training model to develop the competency of test instrument arrangement using the standard of international mapping and benchmarking with the V'Aikens coefficient of 0.91-0.97, where the inter-rater reliability can be categorized as "very good", (2) the effectiveness results of the pre-service training model implementation in developing the competency of test instrument arrangement with the standard of international mapping and benchmarking, and (3) the practicability level of the model, which can be categorized as "very good" according to the lecturer and the student.

Keyword: *pre-service training model, pre-service science teachers, test with international mapping standard*

INTRODUCTION

The era of disruption 4.0 occurs when the movement of industrial world or work competition is no longer linear. The change is very fast and fundamental which substituting the old patterns to create a new order. It overturns the systems that already exist since ten or even hundreds of years and replaced with a new system. The system is driven by innovative and creative young generations with their digital literacy.

This era is like a double-edged sword which has positive and negative impact. For example, the change in the international world directly influence most of countries. It give effect to the social, politic, even mental and nation. It is a real challenge for education to prepare the innovative and creative young people. Therefore, it is very important to develop science literacy and high-order thinking skills, especially related to international benchmarking surveys such as Program for International Student Assessment (PISA).

PISA is a test system organized by the Organization for Economic Cooperation and Development (OECD) [1], to evaluate the education system of 72 countries around the world. Every three years, a 15-year-old student is randomly selected, to take the tests of three basic competencies, namely reading, math and science. The test measures what students know and what they can do (applications) with their knowledge. The theme of the survey is changed every 3 years and in 2015 the focus is on the competence of sciences.

The Indonesian government begin to give serious attention to international surveys or mapping as it relates to the nation's competitiveness in the global era. Head of Research and Development Board, Ministry of Education and Culture, Totok Suprayitno, says that the improvement of Indonesia's achievements in 2015

is well-enough though the results are still below the OECD mean. Based on the mean score, there is an increase in the score of PISA Indonesia in the three tested competences, especially in science competence, from 382 points in 2012 become 403 in 2015, the mathematics competence increase from 375 into 386. Meanwhile, reading competence has not shown significant increase, i.e 396 to be 397. It elevates Indonesia's position in 6th place compared to the second-ranked of the lowest in 2012 [2].

Moreover, based on the median score, the achievement of Indonesian student on reading is getting higher, from 337 in 2012 to be 350 in 2015. The mathematical score raise 17 points from 318 into 335. The highest improvement is in the science area which increase from 327 into 359. This higher median comparing to the mean can become a good indicator to improve the access and the quality distribution inclusively [2].

Further, Head of Educational Assessment Center of Research and Development Board, Ministry of Education and Culture says that there is a consistent increase on the sampling coverage of Indonesian students, i.e. 46 percent in 2003 to 53 percent in 2006. Furthermore, the score rise from 63.4 percent in 2012, and became 68.2 percent in 2015. "Increasing the coverage of this sampling is an evidence that the program of 9-year compulsory education and the expansion towards a compulsory learning of 12 years as well as the inclusion of Indonesian student participation in education is fruitful," as he said in Jakarta on Tuesday [3].

The most important thing of these international benchmarking surveys, such as PISA, is the information that can be followed-up based on the diagnoses from the survey. The achievements must be gradually improved through the enhancement of the education quality in Indonesia. If the increase rate in 2012-2015 can be maintained, then, by 2030 our achievement will be equal to the average achievement of OECD countries. Therefore, it is important to include PISA assessment in the learning process, especially for pre-service teacher program because the quality standard of sciences teachers in Indonesia need to be improved, particularly related to international benchmarking surveys.

Based on the above problem analysis, the purpose of this research is to improve the competence of professional pre-service teacher of sciences field in the assessment development of international standard benchmarking for global competitiveness. The strategic target is the students of pre-service teachers in the Institute of Teacher Education (LPTK).

RESEARCH METHOD

The research was using Research and Development method, as the research flow illustrated in Figure 1. The phase of "define" or "research and information collection" [4] was the initial research and data collection through literature study, needs analysis and field study. The design or planning phase was the product design including the aim of the product use, the product user and the description of the product components. The stage of develop or develop preliminary form of product was an early product development. The disseminate phase had four developmental steps, namely preliminary field testing which were initial field trials, main product revision or test results revision, main field testing or field trials and operational product revisions [4] or refinement of field test results.

Portfolio documentation techniques were used to collect data related to the Research implementation, such as test guidelines, test materials, answer keys, and student responses as the research sample [5]. The response in this study was obtained after the students worked on a set of international benchmarking PISA survey instruments containing various test item, i.e. multiple choice, matching, essay, and other types. This instrument was made by a collaborative team of researchers and students.

The PISA international benchmarking survey instrument that had been arranged was, then, validated to make sure the instrument can actually describe the aspect being measured [6]. The items were made based on the distributed guideline which was proportional based on the description of the listed material in the curriculum, so that the content validity or theoretical validity is eligible. The coefficient of the content validity in this research was processed based on the given score from expert judgment. After that, the judgment results were computed using the Aiken formula [7]:

$$V = \frac{\sum s}{[n(c - 1)]}$$

$s = r - l_0$

l_0 = the lowest validity score

c = the highest validity score

r = the score from the expert

Four ratings categories were used, namely "irrelevant", "less relevant", "relevant", and "highly relevant" and the Aiken index should be in the score of 0.87 ($\alpha = 0.05$) or 0.93 ($\alpha = 0.01$) [7]. However, according to [8], the validity coefficient around 0.7 is still acceptable and considered satisfactory. Based on the analysis with aiken formula, it was obtained 0.935 for index average of the content validity [11]. The content validity for the instruments of the international benchmarking survey of PISA increased from 0.867 into 1. Thus, it can be concluded that the items of the test instrument are valid.

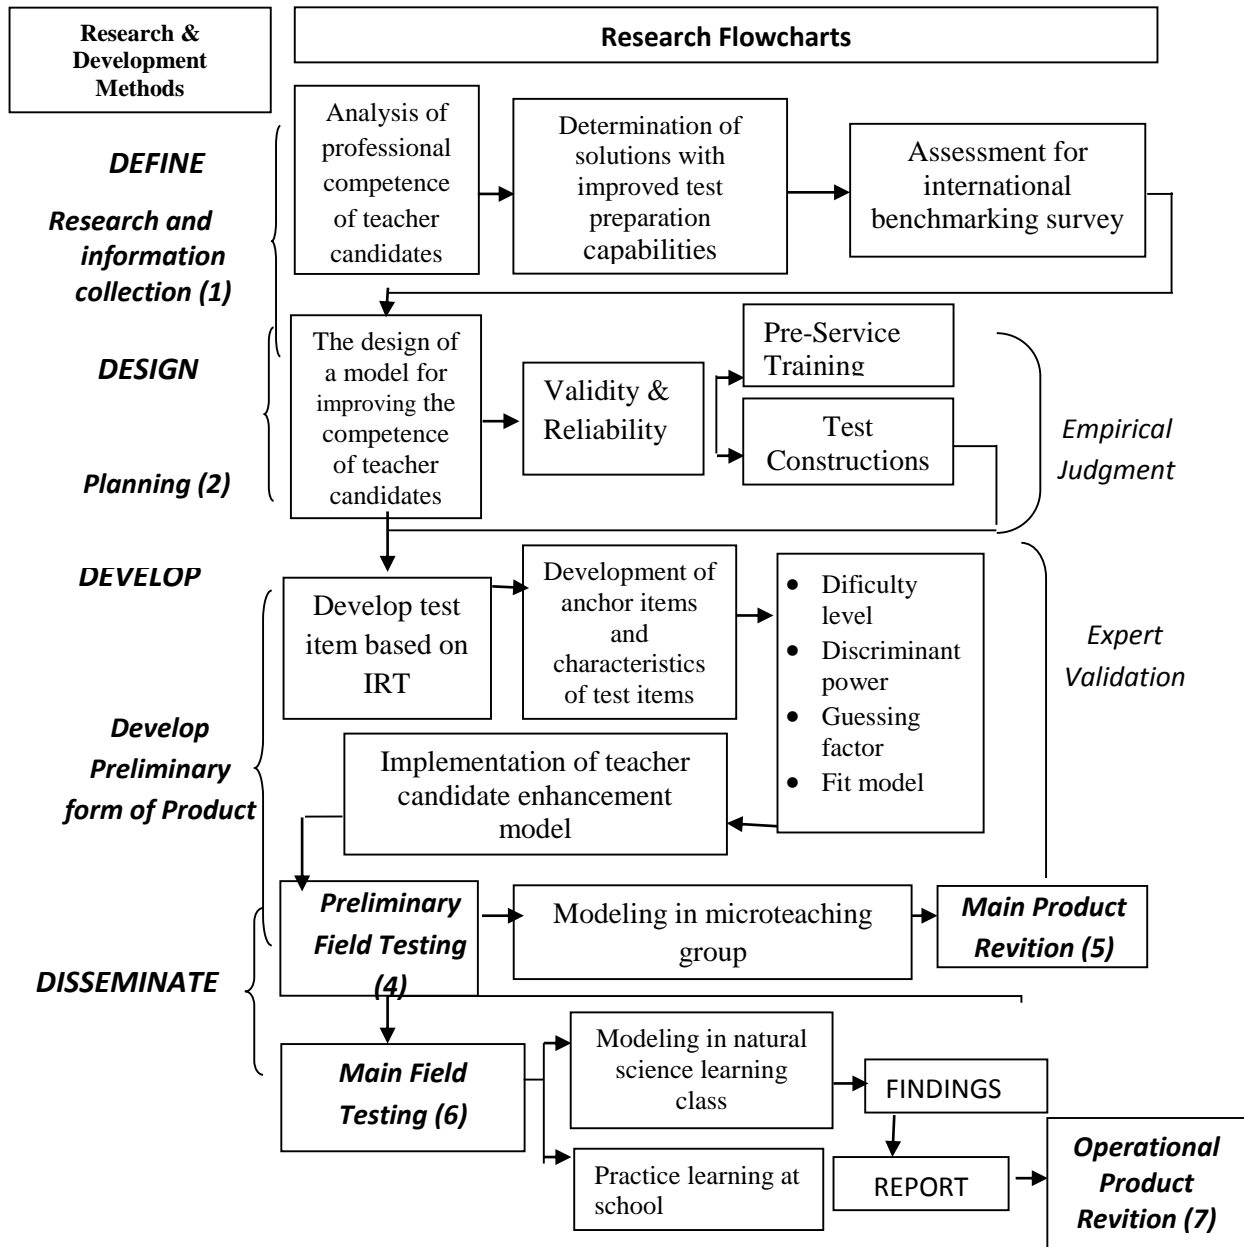

FIGURE 2. Research Design

In the initial field trials and limited trials of PISA international benchmarking survey instrument for integrated science learning, the research subjects involved 6th semester students of Sciences Education Study Program in the year of 2018 who joined microteaching course and the samples were 2 classes, i.e. A and I class. Each class was divided into experimental groups and control group for 5 different subjects. In the microteaching class, the two classes were divided into groups with 10 members of each group that were taught by two lecturers. The experimental design during preliminary field testing was as follows.

TABLE 1. Preliminary field testing design

Class	Pre-test	5 Initial Main Topics	Post-test (1)	5 Following Main Topics	Post-test (2)
A	T ₁	X	T ₂	X	T ₃
I	T ₁	X	T ₂	X	T ₃

RESULT AND DISCUSSION

The basic development of pre-service training model is the ability to make sciences literacy assessment in PISA which contains knowledge within the curriculum and cross-curriculum. Moreover, the measured scientific literacy aspects are as follows: using knowledge and identifying problems to understand facts, making decisions about nature and changes that occur in the environment. The questions of PISA really requires reasoning and problem-solving abilities. A student is considered to be able to solve problems if he/she can apply their acquired knowledge previously to the new unknown situations. In the PISA test items, there are eight characteristics of cognitive ability, such as (1) thinking and reasoning, (2) argumentation, (3) communication, (4) modeling, (5) problem posing and solving, (6) representation, using symbolic, (7) formal and technical language and operations, (8) use of aids and tools

Those eight cognitive characteristics are really matched to the learning objectives of sciences based on the curriculum. It means that PISA problem not only demand the concept application but also how the concept can be applied in various situations, as well as the students' ability of reasoning and arguing in solving a problem.

The PISA Framework of sciences is based on three dimensions: (1) the content (2) the process, from phenomenon observation, connecting the phenomenon with sciences, till solving the problem being observed; and (3) the situations and contexts, as shown in the picture below:

FIGURE 2. PISA IPA Framework

The research results on “define” or “research and information collection” stage [4] begin by analyzing the sciences PISA Framework in the high order thinking skills domain. [9] and [10] defines high order thinking as the use of complex, nonalgorithmic thinking to solve a Task, in which there is not a predictable, well-rehearsed approach or pathway explicitly suggested by the task instruction, or a worked out example. According to Stein, high-level thinking uses complex, non-algorithmic thinking to accomplish a task, some unpredictable, using different approaches for the existing and different tasks from previous examples.

Furthermore, the “design or planning” phase [4] covers a product design that can be produced including the purpose of product use in the form of pre-service training model, product users and description of product components. In this stage, an international standar-benchmarking assessment is prepared based on the specified format in the instrument specification stage, as set out in Table 1.

TABLE 1. Items included in pilot instruments by response types

	Number of Item	%
Essay - Constructed Response	10	20
Essay - Reasoning	10	20
Simple Multiple Choice	10	20
Matching	10	20
True-False	10	20
Total	50	100

The assessment rubric is using the range of 1 to 4 for each indicator. The next step describes each indicator with 4 statements. The statement is adjusted to the aspect and indicator that has been set. The result of this stage is the initial design of the international standard benchmarking assessment. The items are created to fulfill the content validation to make sure that the statement can really measure the indicator of the manipulative skills.

The “develop” or “develop preliminary form of products” [4] is an initial product development. In this stage, the instrument validation of pre-service training model is in the form of assessment draft on international standard benchmarking survey by a lecturer of material expert, a lecturer of assessment expert, and four sciences teachers of junior high school. The content validation stage is performed to determine the feasibility of the instrument related to the appropriateness of the statement with the indicator, the language use in case of communicative aspect. The validators use the sheets in evaluating the developed tool. The sheet itself constitutes the aspects of substance, language and construction.

The obtained scores from all validators for each statement are analyzed using Aiken's formula to calculate the content validity coefficient (V) for each statement. Validator ratings are converted into 4 categories: valid categories without revisions, valid with a little revision, valid with multiple revisions and invalid [12]. The validator input is used to revise the assessment instrument. The V'aiken coefficient is formulated into the mean score to be confirmed with the numbers limit based on table of Aiken's V for the number of categories ranges of 4 with 6 assessors, i.e. 0.78. The result of the validation of the international standard benchmarking assessment with V de Aiken coefficient is 0.91-0.97, while International standard benchmarking assessment obtains the assessment results above the minimum criteria that means the developed assessment is declared valid to be used in the study. However, a valid assessment instrument cannot be considered feasible if it is not reliable so its reliability is clarified through product trials, in preliminary field testing.

The result of item analysis shows that the level of item difficulty in the international standard benchmarking survey begin from 0.189 to 0.889 with the mean score of 0.623. The average level of difficulty categorized as good because according to [12], [13] and [14] for multiple choice with five alternative answers, the optimal difficulty level is 0.59 . Furthermore, referring to [15] criteria, the categorization of the difficulty degree in each items is as follows.

TABLE 2. The categorization of the item difficulty level

Category	Percentage (%)	Item number
Easy	30 (15 items)	3,4,8,9,14,20, 25,27,32,33,38,39,44, 49,45
Moderate	42 (21 items)	5, 7,10,13,17,18,19, 22,23,24, 28,29,30,34, 35,37,40, 42,43, 47,48
Difficult	28 (14 items)	1,2, 6,11,12, 15, 16,21,26,31,36,41,46, 50

The discriminating power of international benchmarking standard-assessment ranges from 0.148 to 0.592 with the mean score of of 0.376. The analysis result for discriminating power of an item use

classical approach (biserial point correlation) indicating that there are 5 items (10%) that can not fully distinguish the ability of pre-service students. This is because those ten items have discriminating power index below the referred criteria i.e. 0.3 ([16], [17]).

The “disseminate” phase in this stage is only 2 stages of the four-step development. They are the preliminary field testing [4] as initial field trial as well as the main product revision or test results revision. Meanwhile, the stages that have not been done yet are the main field testing or field trials and the operational product revision [4] or product improvement based on field test results.

The obtained data in this study is the material mastery in the form of the assessment results on the final and initial assessment of international benchmarking survey standards based on the results of pre-test and post-test. The pretest is given to the student before the benchmarking benchmarking standard assessment development to determine the students' initial mastery of the student material while the post-test is held after the instrument development study in order to know the student mastery of materials after haing treatment. Below is the results description for each data.

The initial data of the students’ science literacy ability and high order thinking skills can be known through pre-test. It consists of 50 items which is given to the experimental group and control group. In summary, the preliminary student ability can be seen in Table 3.

TABLE 3. Parameter Data of Students’ Pre-test for international benchmarking standard

Variable	Score			
	Highest	Lowest	Mean	Std. deviation
Control Class	48	24	38,5	4,32
Experiment Class	51	22	39,2	4,26

The final assessment data of international student benchmarking survey is obtained from post-test. It is employed to the control and experimental group. The test item is similar to the pre-test but the item order is set random. To sum, the data is presented in Table 4.

TABLE 4. Parameter Data of Students’ Post-test for international benchmarking standard

Variable	Score			
	Highest	Highest	Highest	Highest
Control Class	82	52	64	5,72
Experiment Class	90	66	76	6,31

Hypothesis testing is done by using manova test and, based on the above analysis, the data has been known to be normal distribution, homogeneous and independent. Hypothesis testing is done on science literacy data and procedural ability. Based on the calculation resultan, it can be seen that the F test is significant at α 5% so it is not equal to 0. It means the ability of science literacy and high order thinking skills getting influence from the model availability for autonomous learning in case of the development of international standard benchmarking assessment. Having known that the multivariate test is signifikan, Then, the univariate test F is implemented.

TABEL 5. Levene,s test of equality of error variance

Test Type	F	df1	df2	Sig.
science literacy	3.421	1	56	.059
High Order Thinking	3.236	1	56	.062

Based on the table, it can be seen that the significance score between the ability of science literacy and high order thinking skills is not similar, i.e. the significance of science literacy of 0.059 and high order thinking was 0.062. In addition, the manova test can be seen in the following table.

TABLE 5. Test of between-subjects effect

Source	Dependent Variable	Type III Sum of Squares	Df	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	Science literacy	.089 ^a	1	.089	5.162	.025	.081
	High Order Thinking	6346.321 ^b	1	6346.321	164.532	.000	.762
Intercept	Science literacy	15.364	1	15.364	832.864	.000	.898
	High Order Thinking	399616.814	1	399616.814	1.131E4	.000	.986
Perlakuan	Science literacy	.094	1	.094	5.221	.028	.084
	High Order Thinking	6311.038	1	6311.038	162.348	.001	.762
Error	Science literacy	1.024	56	.019			
	High Order Thinking	2098.322	56	39.072			
Total	Science literacy	16.421	57				
	High Order Thinking	425073.023	57				
Corrected Total	Science literacy	1.216	56				
	High Order Thinking	8468.499	56				

Manova analysis is conducted to know whether the independent variable influences the dependent variable. It can be revealed from the corrected models and the treatments. Based on the table, both present the same F-test information. The result of F univariate test shows that it has significance level which less than 0.05, it indicates the model use influences the ability of scientific literacy and procedural ability. Partial Eta Square (PES) scores of science literacy and high order thinking are 0.081 and 0.762, respectively. This means that model usage affect science literacy by 8.1% and by 76.2% for high order thinking [18].

From the analysis result, it can be seen that learning with the model is able to influence the ability of science literacy and high order thinking skills (8.1%) and high order thinking (76.2%). The results of the analysis explain that the students involvement in learning by applying the learning model as an indicator of the learning effectiveness. The students do not only receive the materials from lecturers, but students also try to gain knowledge and to develop themselves. Therefore, learning outcomes is not just about score but it can truly increase the students' science literacy and high order thinking skills.

The students' ability need to be trained by working with the test item of international standard benchmarking assessment, so that the application of learning model can be optimal. It requires not only hard-skills but also soft-skills for hard work and smart work in groups. This is in line with [19], that student soft-skills can be improved by context-based learning, for example the application of procedural knowledge in sciences learning.

That ability can be seen clearly when the students are able to finish the test individually or in groups. It can be detected through their ability to explain the exercise completion [20]. In accordance with the principle of learning model, it urges students to be active during the learning process because it requires students to make their own questions and answers based on the given questions by the lecturer through stimulus in the form of pictures, stories, diagrams, etc.

The students are also trying to gain knowledge and develop themselves and by applying the learning model, it can encourage students to do their best. Through application of learning with the model, the students are not only enthusiastic in doing assessment based on international benchmarking surveys, but also train them to learn in groups. The international standard benchmarking assessment make students to convey ideas, ideas, opinions. Purwoko, etc. [21] show that the frequency of student involvement in learning in line with the improvement of teachers' competency. In addition, the students also learn to appreciate ideas, and opinions from others.

CONCLUSION

Based on the description of research findings and discussion above, it can be concluded that the developed pre-service training model has been able to improve the professional competence of pre-service science teacher in the development of international standard benchmarking survey (PISA) assessment. The indicators include (1) the valid pre-service training model to develop the competence of test instrument arrangement based on the standard international benchmarking with V'Aikens coefficient of 0,91-0,97, and inter-rater reliability achieve the category of excellent, (2) the effectiveness of model application performed in good category, and (3) the practicality level can be classified as very good according to lecturer and student, and (4) the model of pre-service teachers competence improvement in developing assessment with international benchmarking standard by employing the pre-service training model has not shown significant improvement, therefore it needs further treatment.

ACKNOWLEDGMENT

Our gratitude goes to Universitas Negeri Yogyakarta, especially Faculty of Mathematics and Sciences which has provided opportunities as well as financial and managerial support for this research implementation.
